Spectral Radiance of Snow and Clouds in the Near Infrared Spectral Region Francis R. Valovicin, 1978 The near infrared spectral radiance measurements of snow and cirrus and cumulus cloud backgrounds taken by the Air Force Geophysics Laboratory's flying laboratory are evaluated. From the analysis of the 124 spectra obtained, the spectral radiances or reflectance characteristics of snow and cirrus and cumulus clouds between 5500 and 7000/cm (1.82-1.43 micrometers) were determined. Snow/cloud discrimination can be made by utilizing a sensor in the 5500 to 7000/cm spectral region. Based on the analysis of these data, certain snow/cloud design parameters were identified; that is, slope of the spectral radiance, absolute spectral and/or total radiance, and the location and value of the maximum spectral radiance for the snow and cirrus and cumulus cloud backgrounds. Finally, specific recommendations are made for an optimal operational snow/cloud discrimination radiometer. (Author).

Bombers over Sand and Snow Alun Granfield, 2011-10-05 205 Group RAF provided the only mobile force of heavy night bombers in the Mediterranean theater in the Second World War. It operated mainly from bases in Egypt, Libya, Tunisia and Italy, with occasional excursions to Malta, Greece and Iraq, attacking tactical and strategic targets according to the demands of the wider war in the theater. The force was relatively small when compared with the numbers of aircraft available to Bomber Command in the Western European theater, and it carried on using the venerable Vickers Wellington long after this aircraft had been relegated to the training role in the United Kingdom. Like their UK-based counterparts the night bombers were intended to operate in a strategic role, bombing targets away from the immediate battlefield. However, the demands of the war in the Middle East and Mediterranean soon diverted the bombers from their strategic role and saw them operating much closer to the front line in support of the hard pressed ground forces. The bomber squadrons in North Africa usually operated from Advanced Landing Grounds scraped out of the bare desert, with only a few tents for shelter. In Italy they did

have more or less permanent bases, but they still lived in tents (if they were lucky) often surrounded by a sea of mud. There were no pubs, often no beer, and the only contact with their families were the eagerly awaited letters from home. Also the squadrons in England did not have Rommel continually knocking on their door. Thus, the operations of the night bombers in the Middle East and Mediterranean were often governed by the general progress of the war in the theater. The ebb and flow of the land battles not only determined the activities of the night bombers, but also determined their location. This book tells their story.

Remote Sensing of Energy Fluxes and Soil Moisture Content George P. Petropoulos,2013-10-28 Integrating decades of research conducted by leading scientists in the field, *Remote Sensing of Energy Fluxes and Soil Moisture Content* provides an overview of state-of-the-art methods and modeling techniques employed for deriving spatio-temporal estimates of energy fluxes and soil surface moisture from remote sensing. It also underscores the range of such techniques available nowadays as well as the operationally distributed networks that provide today in-situ validated relevant observations. The book brings together three types of articles: Comprehensive reviews that examine the developments in concepts, methods, and techniques employed in deriving land surface heat fluxes as well as soil surface moisture on field, regional, and large scales, paying particular emphasis to the techniques exploiting Earth Observation (EO) technology Detailed insights into the principles and operation of the most widely applied approaches for the quantification and analysis of surface fluxes and soil moisture with case studies that directly show the great applicability of remote sensing in this field, or articles discussing specific issues in the retrievals of those parameters from space Focused articles integrating current knowledge and scientific understanding in the remote sensing of energy fluxes and soil moisture, that are highlighting the main issues, challenges, and future prospects of this emerging technology. Designed with different users in mind, the book is organized in four more or less independent units that make specific information easy to find. It presents a discussion on the future trends and prospects, underlying the scientific challenges that need to be addressed adequately in order to derive more accurate estimates of those parameters from space.

These conferences have become an important event for the international exchange of information on recent developments in snow engineering. The following thematic areas were discussed in the technical sessions and are here presented in this volume: - Transportation - Housing and Residential Planning - Snow Loads - Ski Mechanics - Hazard Mitigation - Snow Technology and Science - Avalanche Engineering

Supporting Capacity of Processed Snow Runways Albert F. Wuori, 1962 A study of the wheel-load supporting capacity of processed snow runways was conducted. Static load tests were made on processed snow in test bins to determine the extent of disturbance by a surface load and type of failure produced. Test sections of processed snow runways were trafficked with an aircraft tire using wheel loads up to 35,000 lb. Ram hardness, unconfined compression, and California Bearing Ratio field tests were also performed, and results of the tests were compared. It was found that it will be possible to predict the supporting capacity of snow pavements from the results of simple tests, especially the ram hardness tests. (Author).
